Case study: Moosic social network platform

We want to create a social network platform by following the requirements:

- User can share short video to thousands of users.
- User activities like, comment and share.
- User can chat
- User can use and login only from Cambodia

On-Premises Approach:

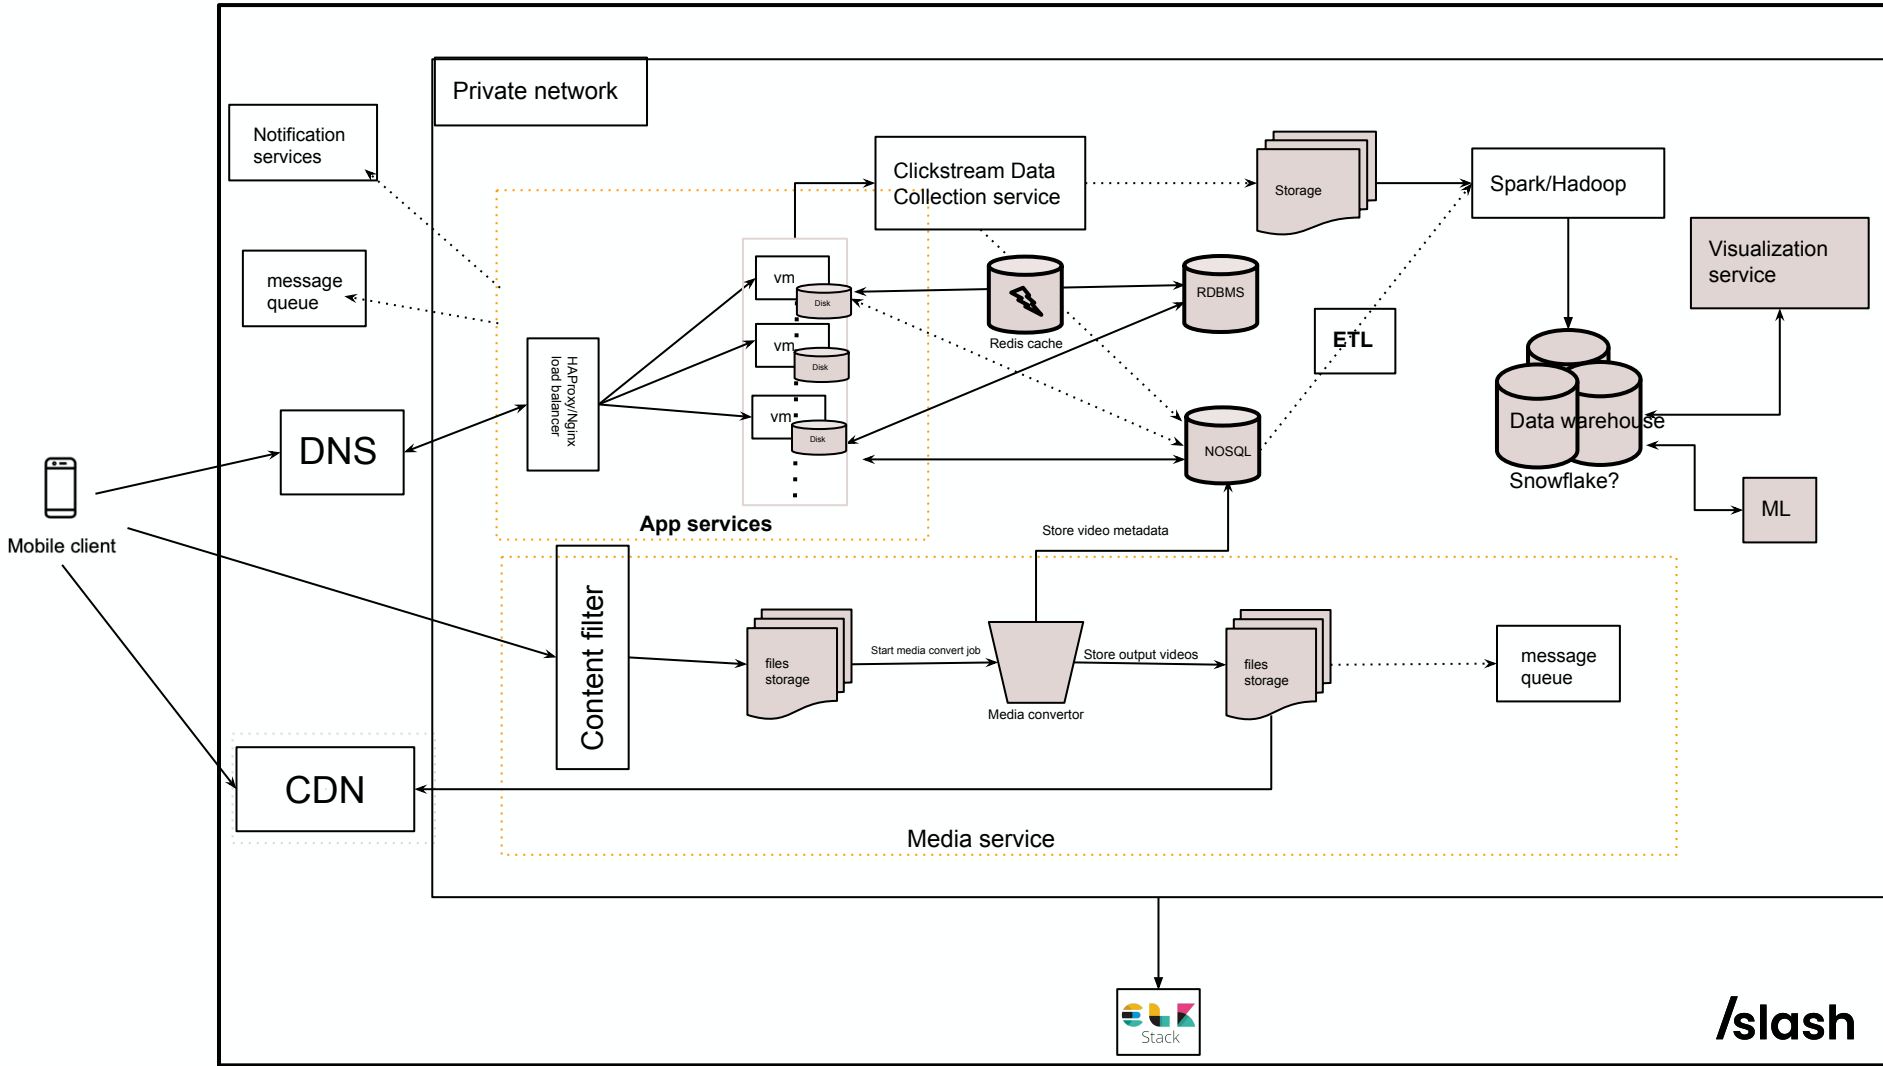

We need:

- On premises servers
- Datacenter Space
- Local ISP
- Electricity and Backup power Generator
- IT specialist

Time launch:

- At least 6 months to one year

Upfront cost is very high, while monthly cost is not small

Assume go with on-premise:

After 6 months, we launched successfully.

And after 3 more months,

- Hit with 500% users increase
- Our Cambodian people and other people from oversea wanted to use also

What are the challenges?

After a lot of demands,

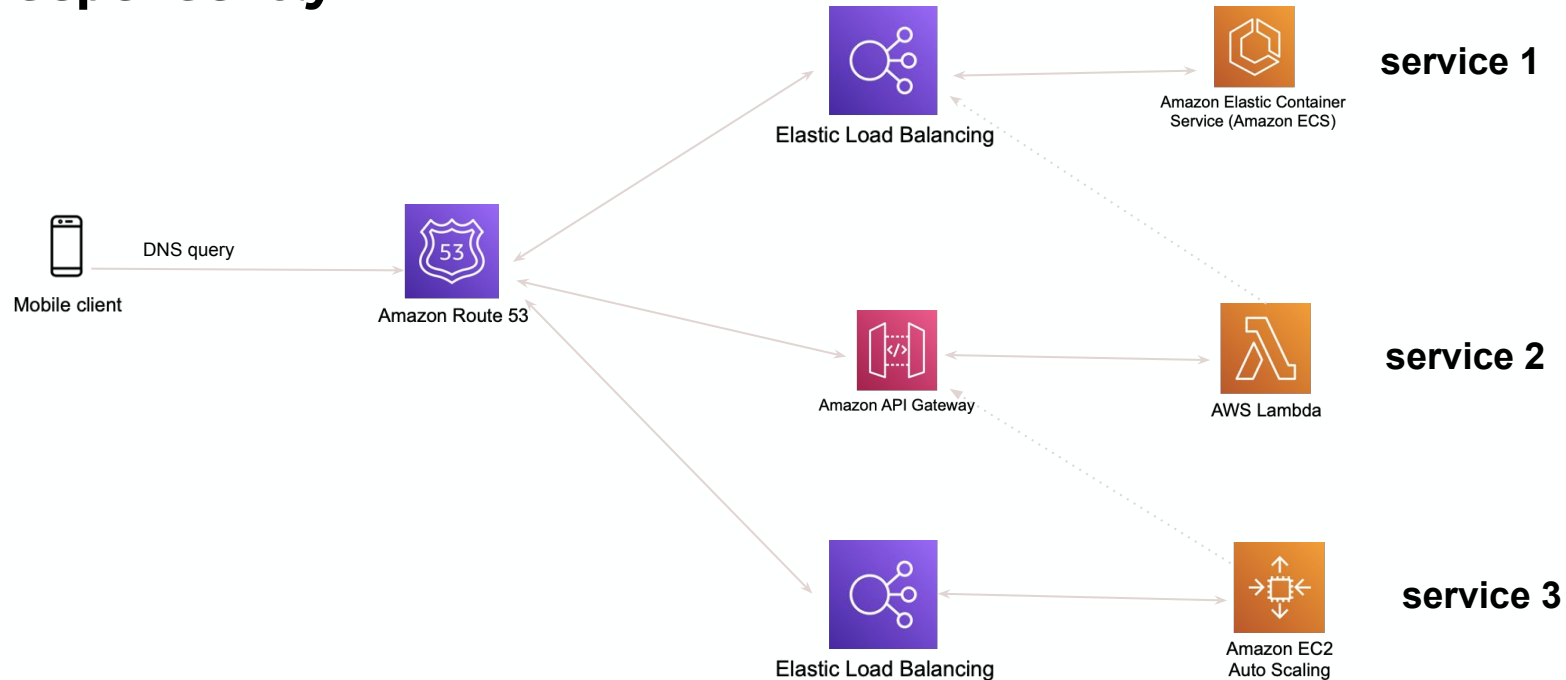

- We need more servers on-premise (CPU, hard disk, RAM)
- Latency issue from India, USA, China, Australia

As a result, we lose users

Cloud Approach use AWS services:

- Scalability
 - Microservice Architecture with Serverless or EC2
 - Provision new instances fast (auto scaling)
- Security
 - Secure user's videos by giving access to their own s3 folder
- Cost efficiency
 - Adaptive streaming with caching
- High Performance
 - The database should scale and high read throughput

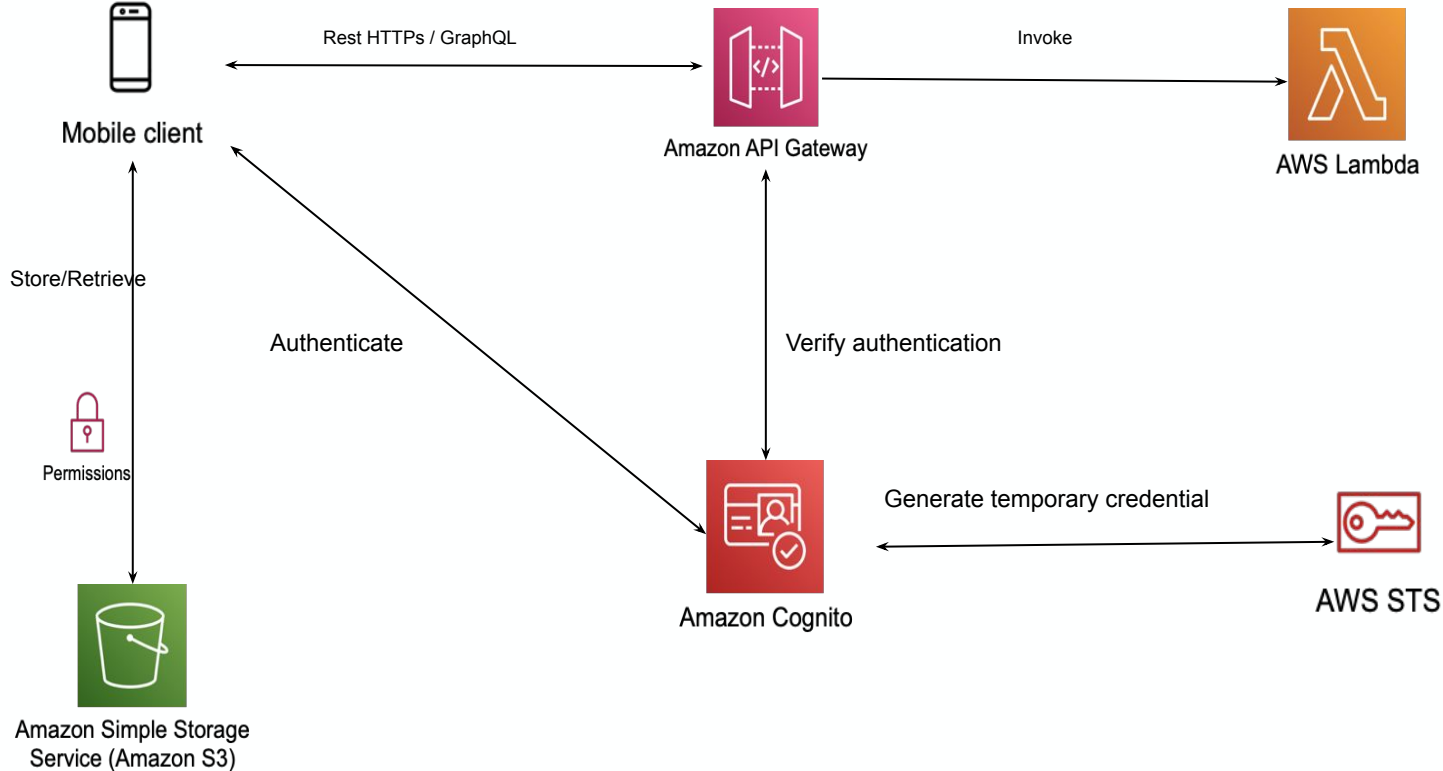

Microservice Architecture with Serverless or EC2 and scale independently

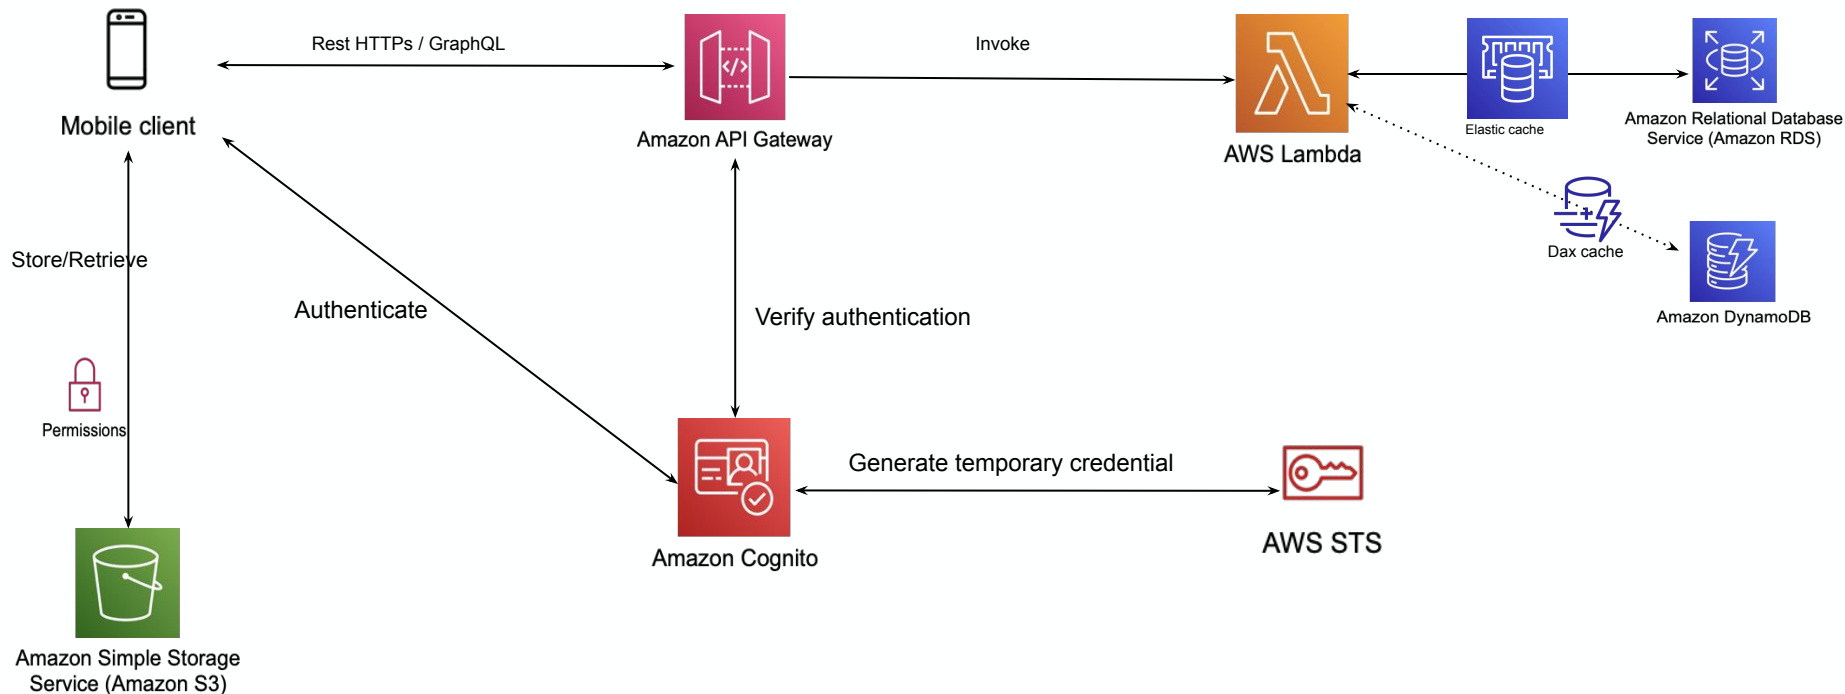

Mobile App Rest API with HTTPs

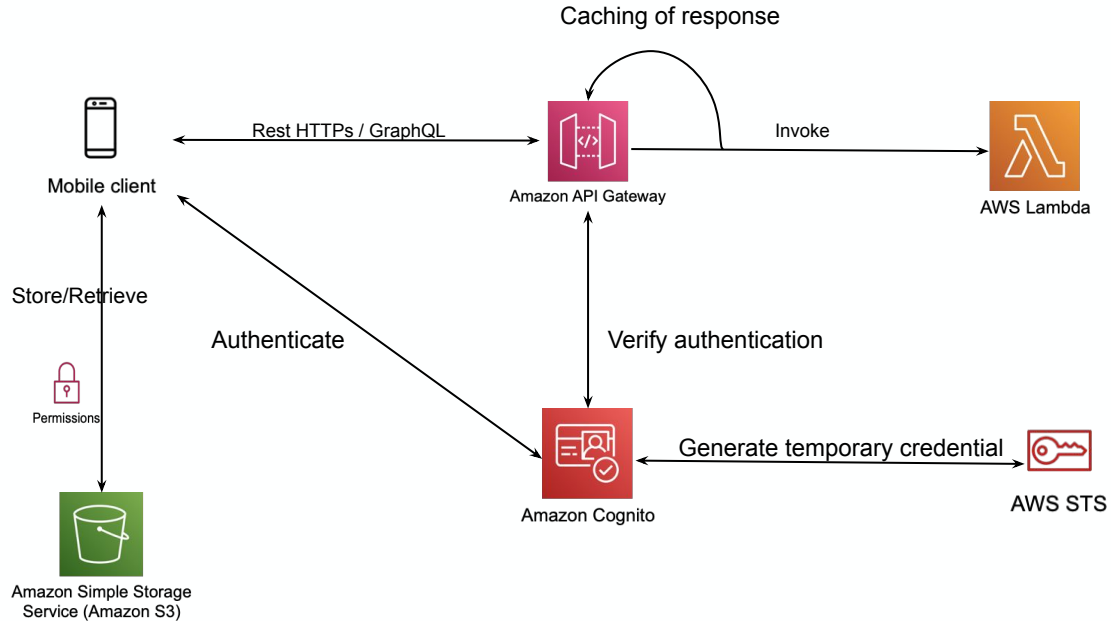

Giving user access to s3

Reduce load off of databases for read intensive workloads

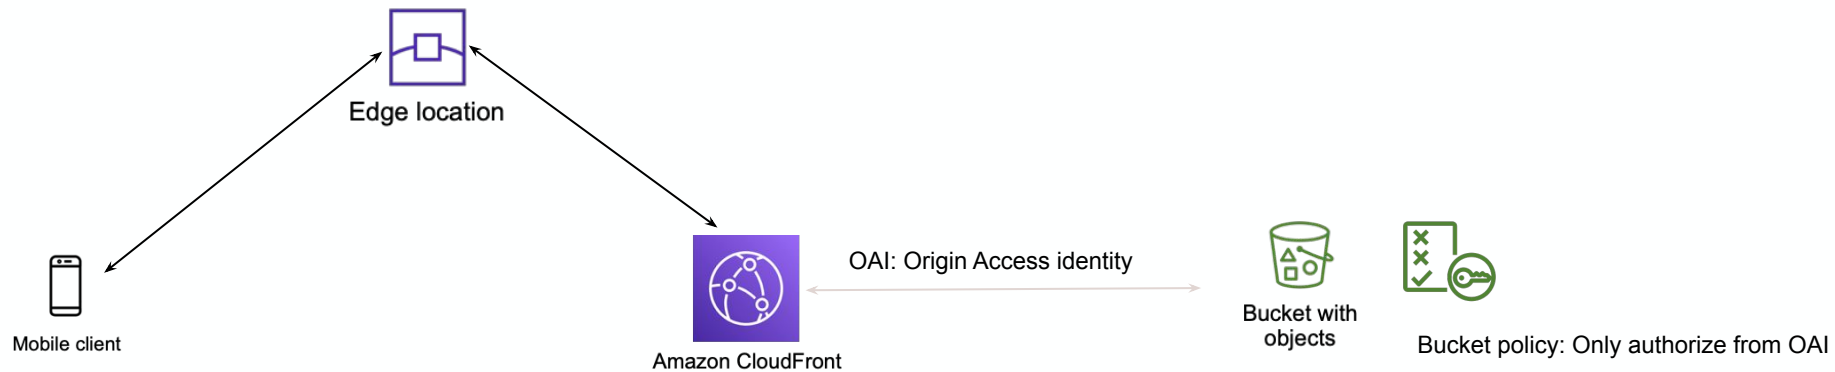

Caching at API gateway

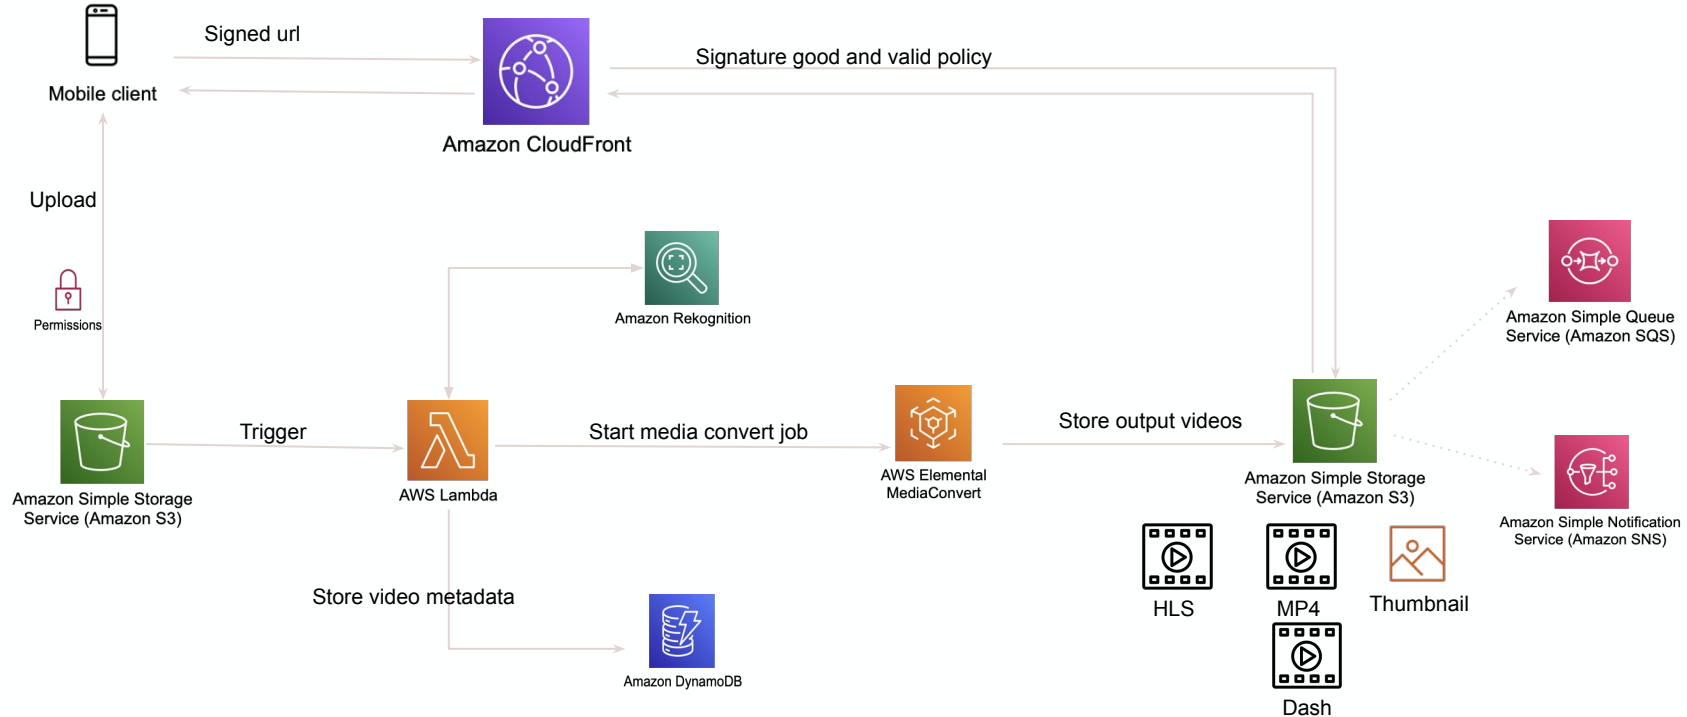

Serving videos content globally

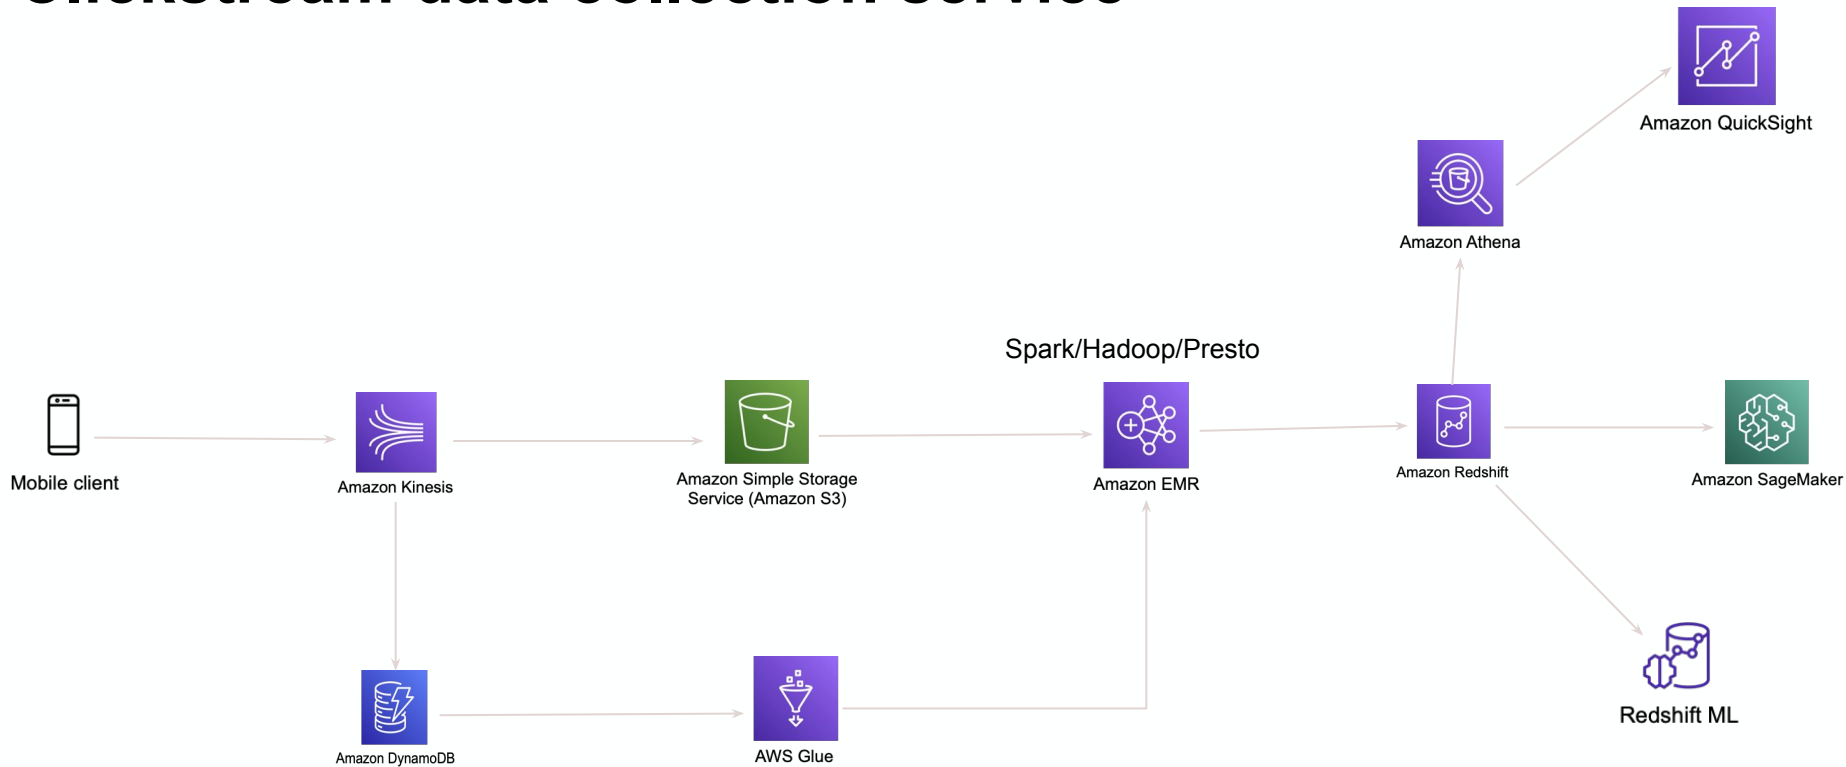

Serving static videos content globally: More secure

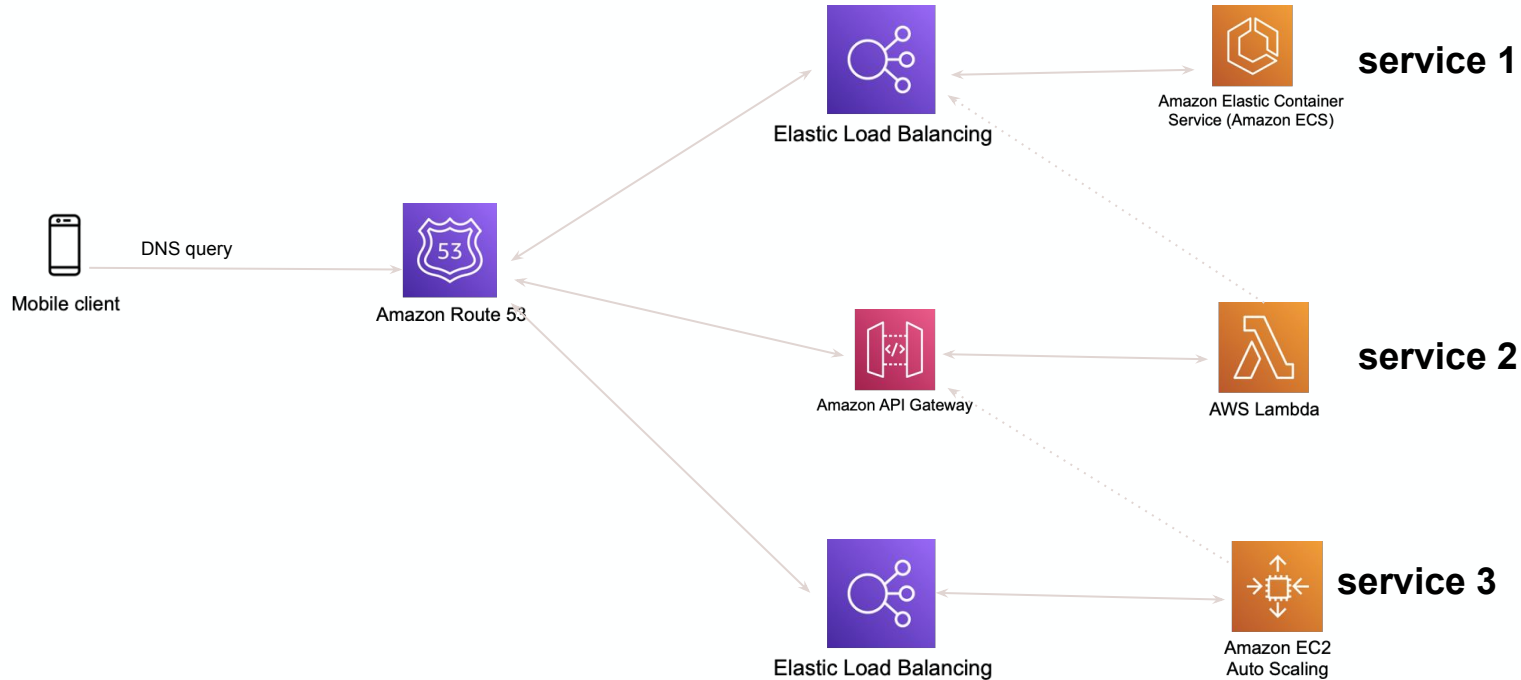

Compression, thumbnail and apply watermark on video content

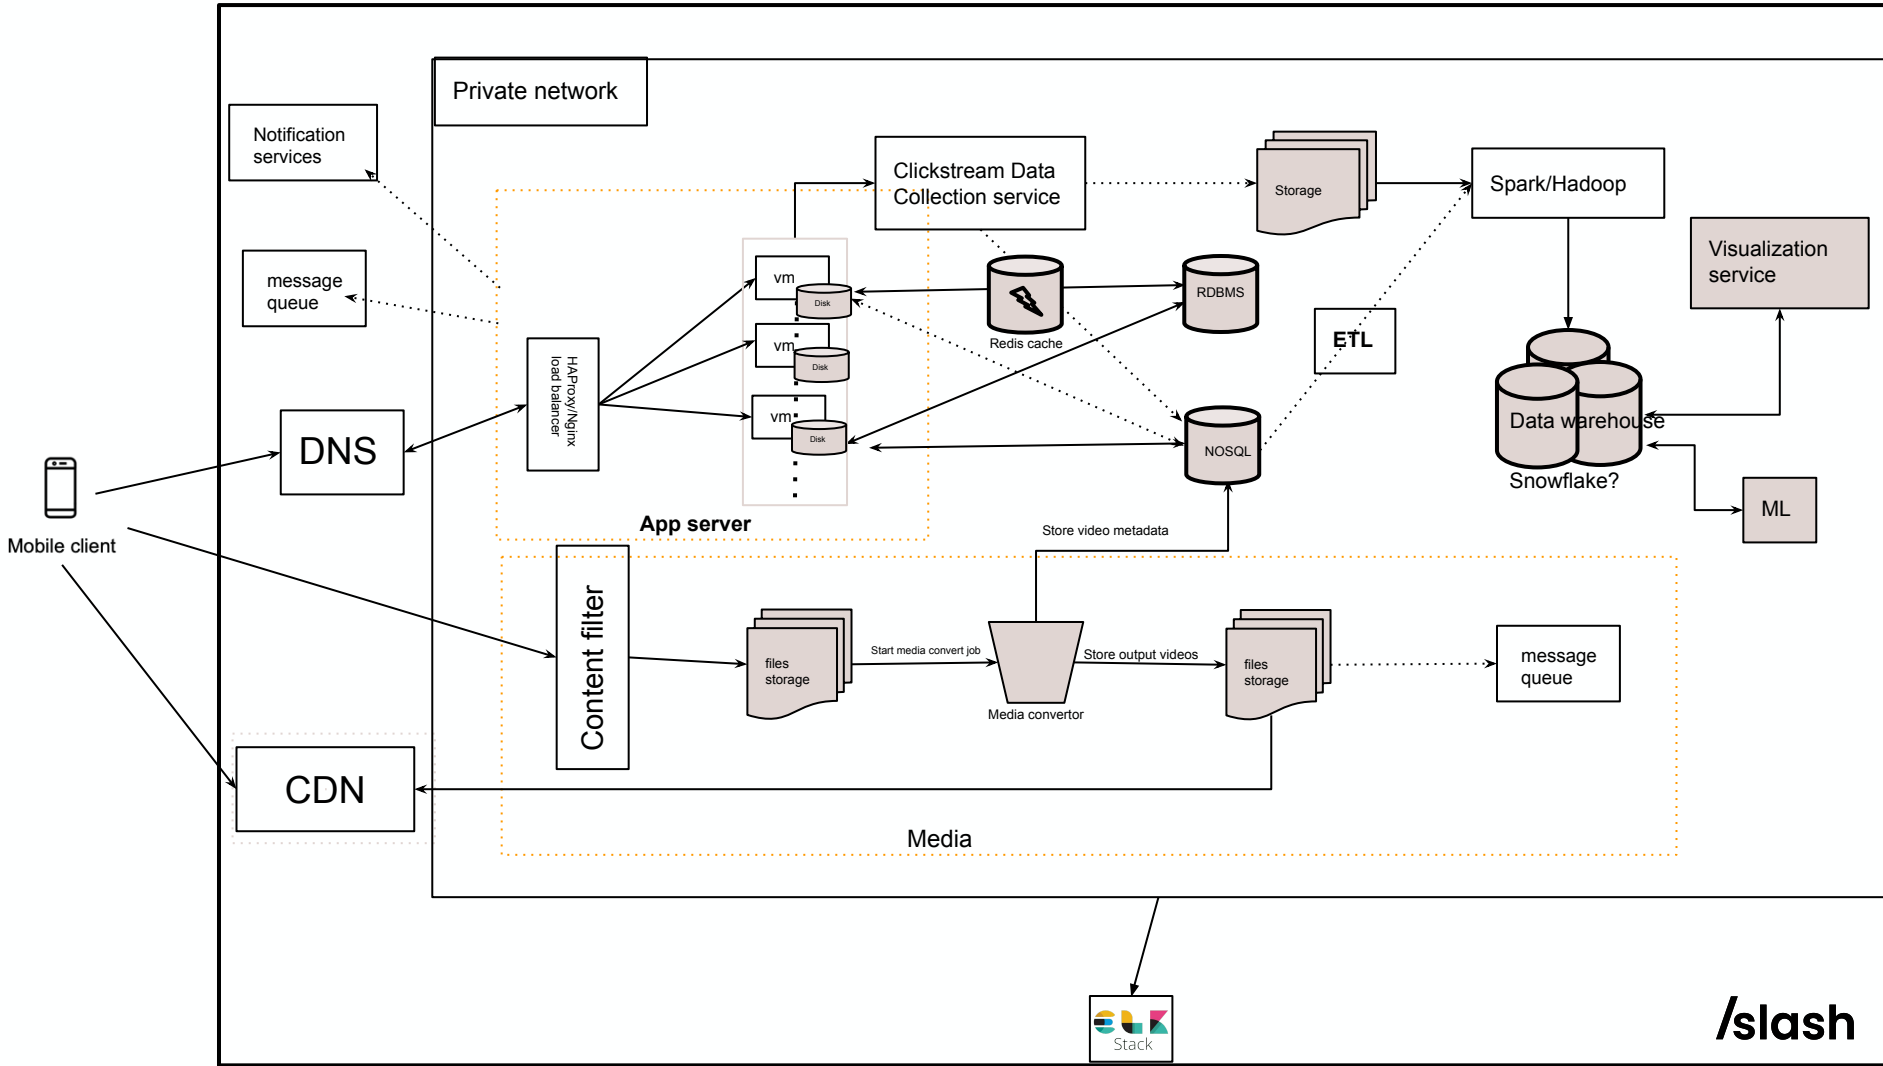

Clickstream data collection service

Microservices with scale independently
